

Data reshaping

The spread function

Structure of the `spread` function

`spread` takes rows and turns them into columns.

```
name_of_dataset %>%  
  spread(  
    key = column_one,  
    value = column_three  
  )
```

- The `key = input` is the name of a column of categorical data. The categories will become the names of new columns after running the `spread` function.
- The `value = input` is the name of a column containing values that you want to spread into the new columns you created with the `key = input`.

Untidy data example

Untidy data frame stored in `table2`

| Afghanistan | 1999 | cases | 745 |
|-------------|------|------------|------------|
| Afghanistan | 1999 | population | 19987071 |
| Afghanistan | 2000 | cases | 2666 |
| Afghanistan | 2000 | population | 20595360 |
| Brazil | 1999 | cases | 37737 |
| Brazil | 1999 | population | 172006362 |
| Brazil | 2000 | cases | 80488 |
| Brazil | 2000 | population | 174504898 |
| China | 1999 | cases | 212258 |
| China | 1999 | population | 1272915272 |
| China | 2000 | cases | 213766 |
| China | 2000 | population | 1280428583 |

by Garrett Grolemund and Hadley Wickham.

spread example

```
table2 %>%  
  spread(  
    key = type,  
    value = count  
)
```

spread example

```
table2 %>%  
  spread(  
    key = type,  
    value = count  
)
```
